ShowMail

This is brainstorming for a potential new feature (likely a wiki plugin)

Use case:

- User gets email with another system or in Tiki Webmail)
- User wants to archive an email in Tiki where it can be shared in a wiki page or tracker, ideally in a way where it's possible to reply
  - *Save it in *.eml format to Tiki File Gallery and display it via the wiki-plugin?* ⚑
- Needs to be searchable

Perhaps a new plugin (or tracker field type?) "ShowMail" which is similar to PluginCode but specialized in emails so

- it deals with indentation of messages
  - *indentation? you mean monospace text only formatting or HTML message format?* ⚑
    - I mean different levels of replies but you bring a good point about HTML mail support. Can be messy ⚑
- permits to respond to the mail
  - This should start your desktop email client
    - `mailto:` *should be able to handle that - you can add* `?subject=`*... not sure about the body of the message though* ⚑
  - Later, this could reply in Tiki Webmail
    - *+1* ⚑
- permits searching on specific fields (if this code can read the mail, it can distinguish subject from to, etc.)
- we could make a new Email message mode for Code Mirror ↗
- it could parse text-only email syntax like `*bold*`, `/italics/`, smileys, and different levels of replies: `>>`

We can parse mails with * https://github.com/zendframework/zend-mail ↗

- http://williamdurand.fr/EmailReplyParser/ ↗ -> very useful for Mail-in and Conversation threading

What should the name of this feature be?
- ShowMail?
  - *+1* ⚑
- ViewMail?
- ReadMail?
