

The Tiki 27 plus Build System

In Tiki27 a new build system was introduced [MR3760 ↗](#) as part of the [path rework project ↗](#). This [reduced the code base by 700 000 lines!](#)

This page will describe what you need to know to switch from using previous Tiki versions up to 26.x when installing Tiki using git.

- You need to install [node.js ↗](#)
- Then run `sh setup.sh` and press return to run the build step (which will also run the composer `vendor_bundled` install)
- If you have a cron job running you need to change the command to (something like):
 - `cd /home/tiki/master; php8.2 console.php -q vcs:update; sh setup.sh -p php8.2 -k build;`

Install node.js and npm on Debian12

Log using ssh as your www tiki user (don't use root)

Use [https://nodejs.org/en/download/package-manager ↗](https://nodejs.org/en/download/package-manager)

Select the version you need using the dropdown

Install the version as displayed check it is installed

Troubleshooting

To check which node your user is using `which node`

To check which npm your user is using `which npm`

To remove installed packages `apt-get purge npm auto-remove` and `apt-get purge nodejs auto-remove`
